

REMOX

Film Coated Tablets - Capsules - Powder for Oral Suspension

Composition:

Tablets: Each REMOX 1000 film coated tablet contains:

Amoxicillin (as trihydrate) 1000 mg

Capsules: Each REMOX capsule contains:

Amoxicillin (as trihydrate) 500 mg.

Powder for Oral Suspension:

Each 5 ml REMOX (125-250) oral suspension contains:

Amoxicillin (as trihydrate) 125-250 mg.

Pharmacological Properties and Mechanism of Action:

REMOX is similar to penicillin in its bactericidal action against susceptible bacteria during the stage of active multiplication. It acts through the inhibition of cell wall biosynthesis by that leads to the death of the bacteria.

Pharmacokinetics:

Amoxicillin is stable in the acid gastric secretion and is rapidly absorbed from the gastrointestinal tract after oral administration. Its bioavailability after oral administration is approximately 70%. The time to peak plasma concentration (Tmax) is approximately one hour. About 18% of total plasma amoxicillin is bound to protein. Amoxicillin is partly excreted in the urine as the inactive penicilloic acid in quantities equivalent to up to 10 to 25% of the initial dose. Various studies have found the urinary excretion to be 50-85% for amoxicillin over a 24-hour period.

Indications:

REMOX is indicated for the treatment of:

- Ear, nose and throat infections caused by susceptible bacterial strains such as some types of streptococci, Streptococcus pneumoniae, Staphylococcus aureus, Haemophilus influenzae.
- Genitourinary infections caused by susceptible strains of Escherichia coli or enterococci.
- Skin and skin structure infections caused by susceptible strains of Staphylococcus and Escherichia coli.
- Lower respiratory tract infections caused by susceptible strains of Staphylococcus, Pneumococcus and Haemophilus influenzae.
- Helicobacter pylori infections and duodenal ulcers, in combination with other drugs.

Contraindications:

Hypersensitivity to the active substance, to any of the penicillins or to any of the excipients.

History of a severe immediate hypersensitivity reaction to another beta-lactam agent (e.g., a cephalosporin, carbapenem or monobactam).

Warning & Precautions:

- Patients may develop diarrhea associated with Clostridium difficile infection.
- Before initiating therapy with REMOX, careful inquiry should be made concerning previous hypersensitivity reactions to beta-lactams.
- In patients with renal impairment, the dose should be adjusted according to the degree of impairment.
- Prolonged use of an antibiotic may result in the overgrowth of non-susceptible organisms (superinfection).

- In patients with reduced urine output, crystalluria has been observed very rarely, predominantly with parenteral therapy.

- Prolongation of prothrombin time has been reported rarely in patients receiving amoxicillin.

- When testing for the presence of glucose in the urine during treatment with amoxicillin, glucose oxidase methods are recommended.

pregnancy & Lactation:

Pregnancy: Category B. REMOX should be used during pregnancy only if clearly needed.

Lactation: Amoxicillin is excreted in breast milk in very small amounts. Therefore, caution should be exercised when administered to nursing woman.

Drug Interactions:

- Probenecid reduces the renal tubular secretion of amoxicillin and thus increases serum levels of amoxicillin.
- Concomitant use of amoxicillin with oral anticoagulants such as aspirin may prolong the prothrombin time.
- Coadministration with allopurinol increases the risk of skin rash.
- Amoxicillin may reduce the effectiveness of oral contraceptives.
- Penicillins may reduce the excretion of methotrexate causing a potential increase in toxicity.
- Tetracyclines and other bacteriostatic drugs may interfere with the bactericidal effects of amoxicillin.

Side Effects:

The most common adverse reactions are diarrhea, skin rash, vomiting, and nausea. Very rare effects: Crystalluria, skin reactions (such as erythema multiforme, Steven-Johnson syndrome), antibiotic associated colitis and convulsions.

Driving & using machines:

No effects on the ability to drive or use machines were observed.

Dosage & Administration:

- Treatment should be continued for at least 48 - 72 hours after the symptoms disappear.
- It is recommended that there be at least 10 days treatment for any infection caused by Streptococcus pyogenes to prevent the occurrence of acute rheumatic fever.
- In some infections, therapy may be required for several weeks.

Dosing Recommendations for Adult and children Patients > 3 Months of Age:

Infection	Severity *	Usual Adult Dose	Usual Dose for Children > 3 Months**
Ear/Nose/Throat Skin/Skin Structure Genitourinary Tract	Mild - Moderate	500 mg every 12 hours or 250 mg every 8 hours	25 mg/kg/day in divided doses every 12 hours or 20 mg/kg/day in divided doses every 8 hours
	Severe	500 mg every 8 hours (Usual maximum dose 1000 mg every 12 hours)	45 mg/kg/day in divided doses every 12 hours or 40 mg/kg/day in divided doses every 8 hours

Lower Respiratory Tract	Mild - Moderate - Severe	500 mg every 8 hours (Usual maximum dose 1000 mg every 12 hours)	45 mg/kg/day in divided doses every 12 hours or 40 mg/kg/day in divided doses every 8 hours
-------------------------	--------------------------	---	---

*Dosing for infections caused by bacteria that are intermediate in their susceptibility to amoxicillin should follow the recommendations for severe infections

** The children's dose is intended for individuals weighing less than 40 kg. Children weighing 40 kg or more give the dose according to the adult dosage recommendations.

Dosing in Neonates and Infants Aged ≤ 12 Weeks (≤ 3 Months):

Due to incompletely developed renal function affecting elimination of amoxicillin in this age group, the recommended upper dose of REMOX is 30 mg/kg/day divided into two doses.

Dosing for H. pylori Infection:

Triple therapy: 1 gr REMOX, 500 mg clarithromycin, and 30 mg lansoprazole, all given twice daily (every 12 hours) for 14 days.

Dual therapy: 1 gr REMOX and 30 mg lansoprazole, each given three times daily (every 8 hours) for 14 days.

Overdose:

Symptoms: Problems of overdosage with amoxicillin are unlikely to occur. Gastrointestinal symptoms (such as nausea, vomiting and diarrhoea) and disturbances of the fluid and electrolyte balances may be evident. Amoxicillin Crystalluria, in some cases leading to renal failure, has been observed. Convulsions may occur in patients with impaired renal function or in those receiving high doses.

Treatment: Gastrointestinal symptoms may be treated symptomatically, with attention to the water/electrolyte balance. Amoxicillin can be removed from the circulation by hemodialysis.

Storage:

Keep out of reach of children. Store below 25° C.

The suspension after preparation is stored in a refrigerator (2-8° C).

Discard the remaining amount of suspension 14 days after preparation.

Packaging: Tablets: Each REMOX 1000 carton box contains 28 film coated tablets in 4 Alu/Alu strips or 14 film coated tablets in two Alu/Alu strips.

Capsules: Each REMOX cross contains 200 capsules in 20 blister strips or 500 capsules in 50 blister strips.

Powder for oral suspension: Each REMOX (125-250) carton box contains amber glass bottle of 60 ml.

*A medication is a product which affects your health, and it's consumption contrary to instructions is dangerous for you.
- Follow strictly the doctors prescription, the method of use and the instructions of the pharmacist who sold the medication.
-The doctor and the pharmacist experts in medicine, it's benefits and risks.
-Do not repeat the same prescription without consulting your doctor.
